A; Molecule type: protein
has strong agglutinating activity and weak cytotoxicity compared
C; Comment: This protein has strong agglutinating activity and weak cytotoxicity compared
C; Superfamily: ricin; rRNA N-glycosidase homology kydrolase; lectin; RNA binding; seed
F; 1-24/Domain: signal sequence #status predicted &SIG>
F; 25-290/Product: agglutinin chain A #status predicted &ACH>
F; 35-291/Domain: rRNA N-glycosidase homology «RNG>
F; 35-291/Domain: rRNA N-glycosidase homology «RNG>
F; 35-291/Domain: signal sequence #status experimental &BCH>
F; 319-364, 352-405-444, 450-485, 490-528, 531-564/Region: 40-residue repeats

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"I constant colland tells and cells and to a less extent to plant cells. The A chain is responsible for inhibiting protein synthesis through the catalytic inactivation of 608 inbookers as a glycosidase that removes a specific adenine residue from an exposed loop of 28s ribosomal RAM. As this loop is involved in the binding of elongation factors, the modified ribosomes are unable to support protein synthesis. The A chain can inactivating them faster than the cell can make new ones. A single A-chain molecule can therefore kill an animal cell. The B chain binds to call receptors and facilitates the entry into the cell of the A chain; B chains are also responsible for cell agolithming the cell agolithming the cell of the A chain; B chains are also responsible for contractive and animal cell of the A chain; B chains are also responsible cell agolithming to cell agolithming to cell agolithming the cell of the A chain; B chains are also responsible cell agolithming the cell agolithming to cell agolithming the cell of the cell agolithming the cell of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specific adenosine on the 28s FRNA.

SUBDIAT: Disulfide-linked dimer of A and B chains.

DOMAIN: The B chain is composed of two domains, each consists of 3 homologue subdomains (alpha, beta, gamma).

PTM: THE MAJOR A-CHAIN IS GLYCOSYLATED ONLY IN POSITION 45 AND THE MINOR A-CHAIN IS GLYCOSYLATED ALSO IN POSITION 271.

SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE RIBOSOWE-INACTIVATING PROTEIN FAMILY: TYPE 2 RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "X-ray structure of recombinant ricin A-chain at 1.8-A resolution.";

"Preproabrin: genomic cloning, characterisation and the expression of
the A-chain in Becherichia coli.",

"Breproabrin: genomic cloning, characterisation and the expression of
the A-chain in Becherichia coli.",

"I Biochem. 198:773-773 [1991].

-!- FUNCTION: THE A CHAIN IS RESPONSIBLE FOR INHIBITING PROTEIN

SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOMAL
SUBDINITS BY REMOVING ADBINITS FROM POSITION 4,324 OF 28 STRNA. THE
B CHAIN IS A GALACTOSE-SPECIFIC LECTIN THAY FACILITATES THE
BINDING OF ABRIN TO THE CELL MEMBRANE THAT PRECEDES ENDOCYTOSIS.

-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-91ycosidic bond at one
specific adenosine on the 28S FRNA.

-!- CHAIN: THE B CHAIN IS COMPOSED OF TWO DOMAINS, EACH DOMAIN

CONSISTS OF 3 HOMOLOGOUS SUBDOMAINS (ALPHA, BETA, GAMMA).

-!- SIMILARITY: IN THE N-TERMINAL SECTION, BELONGS TO THE RIBOSOME-
INACTIVATING PROTEIN FAMILY. TYPE 2 RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. -!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rnw.
-!- SUBUNIT: DISULFIDE LINKED DIMER OF A AND B CHAINS.
-!- DOMAIN: THE B CHAIN IS COMPOSED OF TWO DOMAINS, EACH DOMAIN CONSISTS OF 3 HOWOLOGOUS SUBDOMAINS (ALPHA, BETA, GAMMA).
-!- SIMILARITY: IN THE N-TERMINAL SECTION; BELLONGS TO THE RIBOSOME-
-!- SIMILARITY: CONTAINS 2 ricin B-type lectin domains.

-!- FUNCTION: TRICHOSANTHIN IS AN ABORTION-INDUCING PROTEIN. IT IS
CAPABLE OF INHIBITING HIV-1 INFECTION AND REPLICATION. IT
INACTIVATES EUKARYOTIC 60S RIBOSOMAL SUBUNITS.
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S TRNA.
-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.
TYPE I RIP SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              SEQUENCE FROM N.A.

Bioconj. Chem. 5:423-429(1994).

-i- FUNCTION: RIBOSOME-INACTIVATING PROTEIN OF TYPE 1, INHIBITS PROTEIN SYNTHESIS IN ANIMAL CELLS (BY SIMILARITY).

-i- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at or specific adenosine on the 28S FRMA.

-i- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.

TYPE 1 RIP SUBFAMILY.
                                                                                                                                                                                                                          54; Indels 12; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RIP2 BRYDI STANDARD; PRT; 282 AA.

-!- SUBUNIT: DISULFIDE-LINKED DIMER OF A AND B CHAINS.
-!- DOMAIN: THE B CHAIN IS COMPOSED OF TWO DOMAINS, EACH DOMAIN CONSISTS OF 3 HOWOLOGOUS SUBDOMAINS (ALPHA, BETA, GAWMA).
-!- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE RIBOSOME-
-!- SIMILARITY: CONTAIN PARMILY. TYPE 2 RIP SUBFAMILY.
-!- SIMILARITY: Contains 2 ricin B-type lectin domains.

FEBS Lett. 399:153-157(1996).

-!- FUNCTION: THE A CHAIN IS RESPONSIBLE FOR INHIBITING PROTEIN

SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOWAL

SYNTHESIS THROUGH THE CATALYTIC INACTIVATION 6, 224 OF 28 SRNA. THE

B CHAIN BINDS TO CELL RECEPTORS AND PROBBLY FACILITATES THE ENTRY

INTO THE CELL OF THE A CHAIN; B CHAIN'S ARE ALSO RESPONSIBLE FOR

CELL AGGLUTINATION (LECTIN ACTIVITY).

-! CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one

specific adenosine on the 268 rRNA.

-! SUBUNIT: Disulfide-linked dimer of A and B chains.

-! SUBUNIT: Disulfide-linked dimer of A and B chains.

-! STAMMACEUTICAL: Due to its immunomulative effects it is being

studied in clinical trials in cancer patients as it may slow the

growth of cancer cells and be an effective treatment for solid
                                                                                                                                                                                                                                                                                     "Complete amino acid sequence of the A chain of mistletoe lectin I."; FEBS Lett. 399:153-157(1996).

"Molecular cloning of cinnamomin A-, B-chain and the expression,
"Molecular cloning of cinnamomin A-, B-chain and the A-Chain.";
Submitfication, characterization and mutagenesis of the A-Chain.";
Submitted (SEP-2000) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: EMDOHYDROLYSIS OF THE N-GLYCOSIDIC BOND AT ONE
SPECIFIC ADENOSINE ON THE 28S RRNA.
-!- SIMILARITY: BELONGS TO THE RIBOSOME-INACTIVATING PROTEIN FAMILY.

CONSIGNS OF 3 HOMOLOGOUS SUBDOMAINS (ALPHA, BETA, GAMMA).
-!- SIMILARITY: TO OTHER BACTERIAL AND PLANTS RIBOSOME-INACTIVATING
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        J. Biol. Chem. 266:6848-6852(1991).

-!- FUNCTION: THE A CHAIN IS RESPONSIBLE FOR INHIBITING PROTEIN SYNTHESIS THROUGH THE CATALYTIC INACTIVATION OF 60S RIBOSOMAL SUBUNITS BY REMOVING ADENINE FROM POSITION 4,324 OF 28 S.RNA.ABRINT A IS MORE TOXIC THAN RICIN.

-!- FUNCTION: THE B CHAIN IS A GALACIOSE-SPECIFIC LECTIN THAT FACILITARES THE BINDING OF ABRIN TO THE CELL MEMBRANE THAT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Evensen G., Mathiesen A., Sundan A.;
"Direct molecular cloning and expression of two distinct abrin A-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ٠,
